

Home Garden Lettuce

*By Bob Westerfield

Lettuce (*Lactuca sativa*) is a cool-season vegetable that can be planted in early fall or early spring in Georgia. Lettuce enjoys cool temperatures and can even tolerate a light frost, but extremely cold or hot weather will cause it to perish. Choose an area that receives at least eight to ten hours of sunlight per day.

Soil Requirements

Lettuce can be grown on a wide range of soils but does best on fertile sandy loam soils that are well supplied with organic matter. While lettuce needs sufficient moisture, soggy soils and areas with poor drainage should be avoided. Lettuce is an excellent candidate for growing in raised beds or containers. Like many other garden crops, lettuce prefers a slightly acidic soil with a pH of 6.0 to 6.5.

Planting

Lettuce can be either direct seeded or started five or six weeks earlier inside the house or greenhouse. Lettuce grown in cold frames will take longer to grow and may require 10 to 12 weeks to form a suitable transplant. Prepare the seed bed by tilling to a depth of 8 to 10 inches and removing any large soil clods, sticks or stones. In the absence of a soil test, incorporate 3 to 4 pounds of 5-10-10 fertilizer per 100 square feet of garden area. Smooth the planting area carefully, as a well-prepared seed bed is essential. Lettuce transplants should be left outside for four to five days to become acclimated to outdoor temperatures prior to planting in the garden. Space plants 10 to 12 inches apart in rows that are 18 to 24 inches apart. Direct seeded lettuce can be planted in similar rows or broadcast over the entire bed. If broadcast, seedlings will need to be thinned appropriately to allow space between plants. Lettuce seed is very tiny; therefore, do not plant it too deeply. Seed should be worked in under the soil surface to a depth of 1/8 to 1/4 inch deep and the seed bed firmed lightly with your hand or the top of a hoe to allow maximum sunlight for good germination.

Irrigation

Lettuce seed and transplants should be watered frequently the first two weeks to keep the seed bed moist but not waterlogged. This moist establishment period is essential to get the crop up and growing. Continue to irrigate lettuce every four to five days as needed to keep the plants healthy and producing. Lettuce grown in raised beds or

containers will need to be irrigated more frequently. Lack of moisture can sometimes cause lettuce leaves to taste bitter. Drip irrigation or soaker hoses are the best way to irrigate, but overhead irrigation can also be used when necessary.

Fertilizer

After the initial fertilizer application at planting, apply 2 pounds of 5-10-15 per 100 square feet of bed each month during the growing season. If a soil test has been taken, follow those recommendations.

Weed Control

Because lettuce seed is so tiny, it is important to keep developing weeds from competing with the young lettuce crop. Cultivation, weed control fabrics and mulch are all good organic methods to control weeds. Registered herbicides can also be applied if other measures fail.

Insects and Disease

Lettuce can be attacked by a number of insects, including aphids, armyworms, beetles and cabbage loopers. Diseases may include damping-off, mildews and leaf spots. Both insects and diseases can be controlled primarily by using sound cultural garden practices and recommended chemicals when necessary.

Harvest

Harvest the older, outer leaves as soon as they are large enough to use. Such harvesting can occur as the plants mature. If fully developed plants become too crowded, pull out every other plant to leave more room for the others. Lettuce can be stored in the refrigerator for up to a week. Keep lettuce in bags in the crisper drawer to maintain high moisture.

Varieties

Several types of lettuce can be grown in the home garden. Head lettuce, like those found in supermarkets, do not grow well in the hot Georgia climate and should be avoided. Leaf lettuce does well and may come in various colors with leaves that are smooth, round, wrinkled, serrated or curled. Romaine lettuce forms loose upright plants and can be harvested either as whole plants or the outer leaves can be pulled off a little at a time. Bibb lettuce forms small loose heads and has a mild buttery flavor.

Specific Selections

Romaine: Green Towers, Cimmaron, Super Jericho and Marshall

Loose Leaf: Slobolt, Red Sails, Royal Oak Leaf, Black-seeded Simpson, Ruby, Multigreen 3 and Majesty

Bibb: Buttercrunch, Fire and Ice, Little Gem and Summer Bibb
